

Foam fire extinguishing systems

Product code: 1811102100

Mobile foam fire extinguishing systems are installed in a volumetric manner in rooms with an increased fire hazard for the possibility of localizing fires in the shortest possible time and extinguishing the flame. The principle of operation is to cover the burning surface with a large amount of foam, thereby blocking the flow of oxygen to the fire. This principle makes it possible to extinguish fires even on the surface of oil products. The foam covers almost the entire area of the room, does not cause damage to property and can be easily removed from various surfaces.

Foam fire extinguishing systems are most often used in engine rooms, in warehouses, in places where equipment, fuels and lubricants are stored, etc.

We supply and complete stationary and mobile systems of foam fire extinguishing by volumetric method. The company has stocks of high, medium and low expansion foaming agents for various conditions of use.
